TC Conference; Abstract

FS ASFA1

SL English

AB Various amino acids were tested on **Callinectes sapidus**
and *Cancer irroratus* to determine threshold levels of chemoreception.
Molarities were detected by *C. sapidus* as low as 10^{-12} .
However, *C. irroratus* demonstrated even greater chemosensitivity which
may allow them to utilize darker and therefore deeper habitats than *C.*
sapidus. Some of these amino acids were used as chemical
attractants in artificial bait for *C. sapidus*. The
artificial baits were not as effective as natural bait on the first day
but were nearly as effective on day two.
